Participant Profile Form

MSCA Staff Exchanges 2027 (MSCA-SE 2027) — consortium-building process

Unidad de Excelencia IOBA | University of Valladolid

Purpose:
This form is intended to collect structured information from interested participants for the preparation of an MSCA Staff Exchanges consortium. It is designed to support both (i) later completion of participant-related information requested in the EU Funding & Tenders Portal, and (ii) the creation of an internal profile database to help identify complementarities and facilitate contacts across the emerging consortium.

Please complete one form per:

- non-academic organisation (SMEs, NGOs , patient organisations)
- participating academic team (one form per PI, research-group, department).

This prospective **MSCA Staff Exchanges 2027 consortium** aims to build an international, interdisciplinary and inter-sectoral network in eye and vision research, centred on translational collaboration and staff mobility. Starting from Unidad de Excelencia IOBA's strengths in advanced therapies, biomarkers, inflammation, neuroprotection and health technology assessment, the network remains open to additional interdisciplinary collaborations, including areas such as ocular surface, retina, inherited and age-related eye disease, neuro-vision, optometry, drug delivery, AI-enabled diagnosis and patient-oriented validation, while remaining fully open to any other complementary expertise that could enrich the consortium and strengthen its patient-focused impact.

Important:
- please use this form to capture your general interests, expertise, and rough capacity to send and/or host staff.
- If you are not sure how to answer any field, you may leave it blank and highlight it.

1. Organisation and administrative profile

Organisation legal name	UNIVERSIDAD DE VALLADOLID
Short name / acronym used in projects	UVA
Participant Identification Code (PIC), if available	999862809
Website(s)	https://presstech.uva.es/en/ Pressure Technologies Group (PressTech) https://bioeconomia.uva.es/en/ Institute of Bioeconomy (BioEcoUVa)
Country	Spain
Organisation type	X Academic ☐ Non-academic ☐ Hospital / clinic ☐ SME ☐ Large company ☐ Research infrastructure ☐ NGO / foundation ☐ Public bodv ☐ Other
Main address	Prado de la Magdalena 3-5, Escuela de Ingenierías Industriales, 47011, Valladolid, España
Department(s), institute(s), research group(s) or unit(s) that would be involved	Pressure Technologies Group (PressTech) of the Institute of Bioeconomy (BioEcoUVa) at the University of Valladolid
Additional institutional resources relevant to collaboration	Lab PressTech of the Pressure Technologies Group https://presstech.uva.es/en/labs-and-equipment/

Main contact person for this profile	Juan García Serna, Full Professor at the Department of Chemical Engineering and Environmental Technology of the University of Valladolid

Main contact email	juan.garcia.serna@uva.es
Other contact person(s), if relevant	María José Cocero Alonso, Full Professor at the Department of Chemical Engineering and Environmental Technology of the University of Valladolid, Director of PressTech Research Group and Director of Institute of Bioeconomy.

2. Scientific / innovation profile and relevance for an IOBA-led consortium

Please describe your profile at the level of the participating team / unit most relevant to the prospective consortium.

Indicative thematic relevance (tick all that apply)	
☐ Ocular surface	☐ Retina
☐ Inherited retinal dystrophies (IRDs)	☐ Age-related ocular disease
☐ Neuro-vision / integrated vision / neuro-ophthalmology	☐ Optometry / visual behaviour / rehabilitation
☐ Advanced therapies / regenerative medicine	☐ Gene therapy / cell therapy / tissue engineering
☐ Inflammation / biomarkers / neuroprotection	☐ Drug delivery / formulations / nanomedicine
X Drug discovery / screening / repurposing	☐ Ocular vascular disease
☐ Infection / trauma-related ocular disease	☐ Ocular pain / quality of life / patient-reported outcomes
☐ Health technology assessment	X AI-assisted diagnosis / software / digital tools
☐ Clinical trials / translational validation	X Other (please specify): Analysis of the components in the lab, extraction or reaction. We can also create digital tools using AI.

Free Keywords for internal searchable database (please provide up to 10)	perfluorooctane (PFO), impurity identification (GC-MS), chemical purification, process scale-up, chemical process engineering, supercritical fluid technology, hydrothermal processing, green chemistry and sustainable processes, bioactive compound extraction from biomass, catalysis and reaction engineering
Geographies of interest for exchanges (optional)	

Overview of your research / innovation focus
Our team belongs to the Pressure Technologies Group (PressTech) at the Institute of Bioeconomy (BioEcoUVa) formerly High Pressure Processes Group, University of Valladolid. We work in chemical engineering and sustainable chemistry, designing, modelling and scaling up sustainable chemical processes, from laboratory reactors to pilot plant. *Our most direct link to eye health is our long-standing collaboration with the University of Valladolid Retina Group (IOBA) on the safety of perfluorocarbon liquids (PFCLs) used in vitreoretinal surgery. Following cases of severe acute retinal toxicity linked to contaminated batches of perfluorooctane (PFO), we identified and characterized the toxic impurities in commercial PFO using GC-MS and complementary analytical techniques. This work contributed to peer-reviewed studies on the chemical causes of intraocular toxicity (Regulatory Toxicology and Pharmacology, 2020; Scientific Reports, 2021). We then developed a chemical reaction and purification process to remove these impurities and scaled it up to pilot plant, showing that ophthalmic-grade liquids can be produced reproducibly and safely.* *Our broader expertise covers supercritical fluid technology, hydrothermal processing, catalysis and reaction engineering, and the extraction of bioactive compounds from biomass (e.g. ferulic acid, carotenoids) and biopolymers (pectins, hemicellulose and cellulose), including their formulation in liposomes. We also have strong expertise in process simulation with specialized process simulation software (Aspen Plus and Aspen HYSYS), sustainability assessment, life cycle assessment (LCA) and the development of artificial intelligence tools for process modelling and decision-making. Together, these capabilities allow us to contribute high-purity materials,*

analytical quality control, process scale-up and sustainability evaluation to translational ophthalmic research.

Why your team could be relevant to a translational eye-health and vision consortium

PressTech team offers a process engineering and green chemistry perspective that is rarely found in ophthalmology consortia but is often decisive for moving an innovation from the laboratory to the patient: ensuring that the materials, formulations and products used in the eye can be manufactured with the required purity, safety, reproducibility and sustainability.

Our work with the University of Valladolid retina group (IOBA) on perfluorocarbon liquids shows this added value in practice. After cases of severe acute retinal toxicity caused by contaminated perfluorooctane (PFO), we identified the toxic impurities in commercial PFO and silicone oils by GC-MS, developed a chemical reaction and purification route to remove them and scaled the process up to pilot plant. This scale-up and process expertise, can be applied to other materials complementing the consortium's.

Beyond this direct experience, our expertise in supercritical fluids and hydrothermal processing opens less conventional routes to innovation. These include solvent-free purification and extraction, supercritical CO_2-assisted processing of materials and devices, and the recovery of natural bioactive compounds with antioxidant properties (e.g. ferulic acid, carotenoids), which can be formulated in lipid-based carriers such as liposomes for potential delivery.

We also bring strong computational and sustainability capabilities: process simulation, techno-economic analysis, life cycle assessment (LCA) and artificial intelligence tools for process modelling and decision-making. These can help partners anticipate the cost, scalability and environmental footprint of new therapies and products from an early stage.

Our work is supported by PressTech lab, a 500 m² laboratory with high-pressure and pilot-scale equipment, and by the wider Institute of Bioeconomy (BioEcoUVa), which provides additional scientific and technical support. Altogether, our team strengthens the consortium's ability to turn promising ophthalmic research into safe, high-quality and sustainably manufactured solutions for patients.

3. Expertise, assets and collaboration interests

Core expertise, methods and platforms you could contribute

End-to-end chemical process development, from reaction and separation design at laboratory scale to pilot-plant validation. Our strong orientation towards industrial application is supported by extensive experience in competitive research projects, collaboration with industry and technology transfer.

- ***Chemical safety of ophthalmic materials:*** *identification and quantification of toxic impurities in perfluorocarbon liquids (e.g. perfluorooctane) and other components used in vitreoretinal surgery, by GC-MS and complementary analytical techniques, in collaboration with the IOBA retina group.*
- ***Purification and reaction engineering:*** *design of chemical reactions and purification routes to remove harmful impurities and obtain high-purity, ophthalmic-grade liquids and materials.*
- ***Process scale-up:*** *transfer of purification and production processes from laboratory to pilot plant, ensuring reproducibility, quality and readiness for industrial manufacturing.*
- ***Supercritical fluid technology:*** *supercritical CO_2 and water processes for solvent-free extraction, purification, material processing and particle or material engineering.*
- ***Hydrothermal processing and biorefinery:*** *recovery of high-value bioactive compounds with antioxidant properties from biomass (e.g. ferulic acid, carotenoids, polysaccharides such as pectins, hemicelluloses and celluloses). These compounds have been incorporated into lipid-based carriers such as liposomes in collaboration with formulation partners.*
- ***Catalysis and reaction engineering:*** *development and kinetic study of heterogeneous catalysts and continuous reactors for selective chemical transformations.*
- ***Process simulation and techno-economic analysis:*** *modelling of complete processes with specialized simulation software to estimate cost, scalability and manufacturing feasibility at an early stage.*
- ***Sustainability and life cycle assessment (LCA):*** *environmental footprint evaluation of processes and products using tailor-made sustainability indexes, supporting greener manufacturing of chemical products.*
- ***Artificial intelligence tools:*** *data-driven models and AI-based tools for process modelling, optimization and decision-making.*
- ***Integrated research ecosystem:*** *PressTech lab, a 500 m² facility with high-pressure and pilot-scale equipment, supported by the Institute of Bioeconomy (BioEcoUVa).*
- ***Collaborative flexibility:*** *ability to adapt our analytical, process and computational capabilities to consortium needs, from troubleshooting the chemical safety of specific products to designing scalable and sustainable manufacturing routes.*
- ***Soft skills:*** *a creative, problem-solving mindset with sustainability at the core of our work. We have a strong commitment to science communication and outreach to society, and experience in interdisciplinary teamwork with industry.*

Infrastructure, equipment, facilities or datasets relevant to consortium work

Facilities and equipment of 500 m² facility PressTech lab at the Chemical Engineering and Environmental Technology Department, School of Engineering, Institute of Bioeconomy (BioEcoUVa), University of Valladolid (https://presstech.uva.es/en/labs-and-equipment/).

*• **Analysis and characterisation lab:** GC-MS systems (Agilent), HPLC with PDA, IR and UV detectors (Waters), portable micro-GC, FT-IR (Bruker ALPHA), portable Raman spectrometer, TOC analyser, particle size analyser (Malvern Mastersizer 2000), surface tension meter (Krüss), moisture analyzer, among others. This lab is the basis for impurity identification and quality control of ophthalmic liquids and materials.*

*• **High-pressure view cells:** four sapphire-window cells (Eurotechnica, SITEC; up to 500 °C and 500 bar) with video recording, for studying phase behaviour, solubility and reactions in supercritical fluids.*

*• **Formulation and particle engineering:** supercritical antisolvent (SAS) pilot plant for microparticles and microencapsulation, PGSS particle generation and drying pilot plant, supercritical CO_2 aerogel drying unit, emulsion formulation plant, spray dryer (Niro Mobile Minor), freeze-dryer, high-shear homogeniser (IKA) and dissolution testing apparatus (Copley, 6 positions).*

*• **Reaction and extraction units:** continuous hydrothermal reactor (up to 454 °C and 225 bar), continuous supercritical CO_2 reaction plant, batch hydrogenation reactor (Berghof), supercritical fluid extraction unit (5 L, up to 400 bar), microwave reactors and synthesisers (Anton Paar, CEM), tubular furnace and inert-atmosphere glovebox.*

*• **Pilot plants (TRL 3–5):** pressurised hydrolysis units PHUn 1 and PHUn 2 (0.5–5 kg/h biomass), patented multi-bed pilot plant PHUn 0, supercritical CO_2 extraction pilot plant and continuous microwave-assisted extraction pilot plant. These plants allow processes to be scaled from laboratory to pilot scale.*

*• **Sample preparation:** planetary ball mill, blade mill, wet mill, filter press and rotary evaporators.*

*• **Computational tools:** Aspen Plus and Aspen HYSYS process simulation software, SimaPro life cycle assessment (LCA) tools and in-house AI and data-driven modelling tools for process design, optimization and sustainability assessment. AI coding tools.*

Training capacity and knowledge-transfer potential

Inbound staff would join a highly interdisciplinary training environment in chemical engineering, green chemistry and process technology within PressTech lab, one of Europe's leading groups in supercritical fluids and high-pressure technologies, supported by the Institute of Bioeconomy (BioEcoUVa) of the University of Valladolid.

From a scientific and technical perspective, visitors would gain hands-on experience in the chemical analysis and quality control of materials and liquids, including impurity identification by GC-MS, HPLC, FT-IR and Raman spectroscopy. This expertise has been applied to perfluorocarbon liquids and other products used in vitreoretinal surgery. They would also be trained in reaction engineering, supercritical fluid and hydrothermal processing, particle engineering and microencapsulation, and the extraction of bioactive compounds from natural sources. A key added value is the opportunity to take a material, formulation or process developed at their home institution and test its purification, formulation or scale-up in our facilities, from bench scale to pilot plants at TRL 3–5.

Inbound researchers could also be trained in process simulation, techno-economic analysis, life cycle assessment (LCA) and artificial intelligence tools for process modelling and optimization. These give clinical and biomedical researchers a practical view of how new ophthalmic products can be manufactured safely, reproducibly and sustainably.

On the translational and entrepreneurial side, staff would benefit from our long-standing collaboration with industry, patent co-invention and industrial R&D experience (which includes six years at Renmatix, Inc. (USA), or two years in Tecnicas Reunidas Madrid). Training would combine lab work with group seminars, doctoral school activities of ESDUVa (soft and transversal skills), international courses of the EFCE High Pressure Chemical Engineering working group and conferences.

Our track record supports this capacity. Over the last decade our team has supervised numerous doctoral theses, many of them international or in cotutelle with Åbo Akademi University (Finland) and Hamburg University of Technology (Germany). Our doctoral graduates have over 95% employability in companies, technology centers and universities in Spain and abroad.

What your team would hope to gain from participating

As chemical engineers, we see participation in this consortium as an exceptional opportunity to learn. Our team is curious by nature and strongly motivated to apply our knowledge to challenges with a direct impact on society and patient health. We are especially interested in gaining insight into ophthalmology and vision science from the clinical and biological side: how ocular diseases are studied, how

therapies and medical devices are validated, and which unmet needs in materials, formulations and manufacturing currently limit their translation to patients.

In particular, we would like to gain access to preclinical models, biocompatibility and toxicity testing platforms, clinical perspectives and regulatory know-how. These would allow us to validate the chemical, formulation and process solutions we develop in a biologically and clinically meaningful context. We are also keen to learn from partners working in drug delivery, advanced therapies, data science and AI, and patient-oriented research. We believe interdisciplinary cross-fertilization between these fields and chemical engineering can open unexpected routes to innovation.

A central objective is to build long-term international collaborations that go beyond short-term exchanges and lead to joint projects, coordinated funding applications, patents and high-impact joint publications. We strongly support the mobility of our PhD students and early-career researchers. Exposure to biomedical and clinical environments would broaden their perspectives, strengthen their adaptability and international networks, and open new career paths at the interface between chemistry, engineering and health.

Finally, we are convinced of the key role of the chemical industry in health and well-being. According to the Spanish Chemical Industry Federation (FEIQUE), the chemical sector is the leading exporting sector of the Spanish economy, supports over one million direct, indirect and induced jobs and accounts for almost a quarter of all industrial R&D investment in Spain. Through this consortium, we aim to strengthen the connection between chemical engineering and eye health, contributing to safer, more sustainable and more accessible solutions for patients transferring knowledge and creating innovative ideas.

4. Key people likely to be involved

Please list the key people who may be relevant to the consortium at this stage. *This is not a final, binding or secondment list.*

Name	Position / role	Department / unit	Staff category	Career stage	Email / identifier (optional)
JUAN GARCÍA SERNA	Full Professor	Chemical Engineering and Environmental Tech.	Researcher	R4 – Leading Researcher	juan.garcia.serna@uva.es
DANILO ALBERTO CANTERO SPOSETTI	Associate Professor (permanent position)	Chemical Engineering and Environmental Tech.	Researcher	R3 – Established Researcher	danilo.cantero@uva.es
FACUNDO MATTEA	Distinguished Senior Researcher Beatriz Galindo	Chemical Engineering and Environmental Tech.	Researcher	R3 – Established Researcher	facundo.mattea@uva.es
MARTA RAMOS ANDRÉS	Postdoctoral Fellowship UVa	Chemical Engineering and Environmental Tech.	Researcher	R2 - Recognized Researcher	marta.ramos@uva.es
VESNA LEONTIJEVIC	Postdoctoral Fellowship UVa	Chemical Engineering and Environmental Tech.	Researcher	R2 - Recognized Researcher	vesna.leontijevic@uva.es
ANDREA CASAS GONZÁLEZ	PhD student UVa and researcher hire by a project	Chemical Engineering and Environmental Tech.	Researcher	R1 – First Stage Researcher	andreapatricia.casas@uva.es

6. Staff-exchange capacity (only rough estimation at this stage)

Please provide only a rough, non-binding estimate of your organisation's/team's capacity to send and/or host staff **over the 48-month duration of the project.**

Could your organisation/team second staff?	X Yes ☐ Maybe ☐ No capacity to send staff on secondment
Could your organisation second staff categories beyond researchers (where relevant to R&I activities)?	X Only Researchers ☐ Technical Staff/Innovation ☐ Managerial / project support ☐ Admin Staff ☐ Other profiles
Could your organisation host incoming staff from academic and/or non-academic sectors?	☐ Academic only ☐ Non-academic only X Both ☐ No capacity to host
Administrative / HR / legal considerations that may affect mobility	none

7. Matchmaking information: Summary for the internal participant database

Capabilities you would most like other interested participants to notice

• **Identification of impurities** by GC-MS and complementary techniques, with proven experience on perfluorocarbon liquids (perfluorooctane) in vitreoretinal surgery, in collaboration with the IOBA retina group.
• **Purification and scale-up from lab to pilot plant:** design of reactions and purification routes to obtain high-purity, ophthalmic-grade liquids and materials, and transfer of these processes to pilot scale (TRL 3–5) in PressTech lab, a 500 m² high-pressure facility.
• **Supercritical fluid technology** for formulation and particle engineering: solvent-free extraction, purification, microencapsulation and particle generation (SAS, PGSS, aerogel drying), and recovery of natural antioxidant compounds (e.g. ferulic acid, carotenoids) and biopolymers for potential applications.
• **Process simulation, sustainability and AI**: process modeling, techno-economic analysis, life cycle assessment (LCA) and AI-based tools to evaluate the cost, scalability and environmental footprint of new therapies and products from an early stage.

Capabilities or expertise you would especially like to access through the consortium

• **Knowledge on preclinical testing**, to design materials and products safe and efficient as intended.
• **Clinical perspective**, to better understand the real needs of patients and clinicians and focus our work where it matters most.
• **Regulatory and translational know-how**, to learn how new products move from the lab to clinical use.
• **New fields and ideas**, such as drug delivery, advanced therapies and data science, where chemical engineering can open new opportunities.
• **Long-term collaboration**, through joint projects, funding applications, publications and mobility for our young researchers.

Please Confirm:

Open to being contacted by other interested participants through the coordination team's mediation?	X Yes ☐ No

X We understand that the information contained in this form will be searchable and accessible to other interested participants within the pre-consortium process.

8. Final remarks and query items

Please note any uncertainties, prerequisites, internal approvals needed, or items that should be considered further before the consortium is consolidated.
None.

Internal use and confidentiality statement

The information provided in this form will be used only for internal consortium-building purposes in connection with the preparation of a prospective MSCA Staff Exchanges proposal (2027 call) coordinated from Unidad de Excelencia IOBA / University of Valladolid. It may be used by the coordination team to: (i) assess strategic fit and administrative readiness, (ii) prepare participant-related information required at proposal stage, and (iii) build an internal profile database to facilitate contacts among interested participants. The information will not be shared outside this pre-consortium context without prior permission from the contributing organisation / contact person, except where later required for the formal preparation of a proposal with the explicit involvement of that organisation. Submission of this form confirms that the contributor agrees to this internal use. Organisations may request correction, update or withdrawal of their information at any time by contacting the coordination team.

X Understood
